

DIRECTION 01 / THREE OF THREE

# Carta

A topographic guidebook. Cream paper, slate ink, brown contour as the recurring decorative motif. Aspires to feel like an heirloom map you'd carry in a chest pocket.

PALETTE

MOSS CRIMSON AMBER RILE

Foreground/background hits AA at 34px+. Contour brown is decorative only — never load-bearing for state.

TYPOGRAPHY

### Summit shapes

*Fraunces 500 · display*

DISPLAY · Fraunces 500 · 64 / 1.02 / -0.025em  
HEADING · Fraunces 500 · 28 / 1.05 / -0.01em  
BODY · Inter 400 · 15 / 1.55  
LABEL · JetBrains Mono 500 · 11 / 0.18em / UPPER

MOTIF & TONE

Hand-drawn contour curves recur in three weights — header dividers, level-card backgrounds, schematic diagrams. Always brown; never holds an action. Display type opens with verbs and concrete nouns: *"Read shape before steepness."*

# Read the mountain before you ski it.

The digital companion to your BASI Alpine Level 4 ISTD navigation workbook. Sixty-six pages, one hundred and sixty cards, two graded quizzes — built for cold huts and quiet evenings.

Continue Level 1 → Open progress

Three levels, in order.

WORKBOOK · 66 PAGES

02 Level index

MOBILE · 375

**Note.** The level number is the dominant typographic gesture — 96px Fraunces in contour brown — so a learner can locate themselves at a glance even on a small phone in cold gloves.

Status badges use real colour (moss / amber / bare circle), never just a tick character; this still legible for red-green colour-blind users because the shape (filled / half / empty) carries the meaning.

Page codes (C2.1) are quoted in monospace because they're literal references printed in the paper workbook — the digital UI honours that.

Summit shapes

Domes, peaks, and plateaux as contour patterns.

LEARNING AIM

Identify the three principal summit forms from contour spacing and shape alone, and predict where the steepest descent line will run.

A summit, on a map, is the smallest closed contour. What lies beneath that single ring tells you most of what you need to know about the descent — long before you see the snow.

Three archetypes recur. Read them in this order:

Dome

Peak

Plateau

How the contour spacing reads

- Dome** — concentric rings, evenly spaced. Predictable, every aspect skis similarly.
- Peak** — rings tightening rapidly toward the summit. Steepest line varies by aspect; read which side compresses first.
- Plateau** — a single broad contour with sub-summits. Navigation hazard in poor vis: no obvious fall line.

| FORM    | SPACING           | RISK NOTE                   |
|---------|-------------------|-----------------------------|
| Dome    | Even              | Convex roll on lower flanks |
| Peak    | Tight near top    | Aspect-driven loading       |
| Plateau | Wide, then sudden | White-out disorientation    |

Summit shapes

Domes, peaks, and plateaux as contour patterns.

LEARNING AIM

Identify the three principal summit forms from contour spacing and shape alone, and predict where the steepest descent line will run before committing to it on the ground.

A summit, on a map, is the smallest closed contour. What lies beneath that single ring tells you most of what you need to know about the descent — long before you see the snow. Read three archetypes, in order:

Dome — even spacing

Peak — tightening rings

Plateau — sub-summits

How the contour spacing reads

- Dome** — concentric rings, evenly spaced. Predictable, every aspect skis similarly. Watch the lower flank for a convex roll.
- Peak** — rings tightening rapidly toward the summit. Steepest line varies by aspect; read which side compresses first.
- Plateau** — broad summit area, often with multiple sub-tops. Navigation hazard in poor vis: no obvious fall line, easy to misread aspect.

| FORM    | CONTOUR SPACING            | ASPECT BIAS | RISK NOTE                                  |
|---------|----------------------------|-------------|--------------------------------------------|
| Dome    | Even all round             | None        | Convex roll on lower flank                 |
| Peak    | Tight at top, looser below | Marked      | Aspect-driven loading on lee               |
| Plateau | Wide, then a sudden break  | Variable    | White-out disorientation; cornice on edges |

ANSWER KEY (TRAINER MODE)

**Q1.** Ten concentric ovals, spacing 22m → 18m → 14m → 10m → 6m. *Dome with steepening lower flank.*

**Q2.** Three contour rings on the SE side, one on the NW. *Peak; NW is the steeper aspect — likely lee-loaded after a westerly storm cycle.*

*Trainer note — when running this with a group, draw the dome first with eyes closed; most students will spread the rings unevenly and reveal what they actually expect.*

07 Progress dashboard

**Information density.** The dashboard is the densest screen in the app deliberately — the user opens it to check status quickly. Each section uses the same skill-row pattern (label → bar → percentage) to make the page legible at a glance.

"Readiness checks" use the four checks the workbook itself defines. They're encouraging but never patronising: *Met / Not started / 34% short* — concrete numbers, not "Keep going!"

WORKBOOK · ED. 3 (FEB 2026)

OFFLINE · YES

BUILT BY · PERFORMOS

Tone of voice.

"Local-first. Nothing leaves this device unless you export it." — sets the contract immediately. The settings page is short on purpose: it's a navigation tool, not the place you live.

Print is broken out as its own section because the workbook author cares about it. A serious learner will print route-card templates the night before and use them in pencil in a hut.

WHY THIS DIRECTION

Carta — rationale

Carta treats the app like an heirloom paper artefact gone digital — the medium your audience already trusts. Cream paper and brown contour ink locate the user inside the visual world of the topographic map; Fraunces gives the headings the gravitas of a guidebook (BMC, Cicerone) without lifting any specific publisher's identity. The contour motif is decorative-only — never load-bearing for state — so the moss-amber-crimson semantic colours stay readable for colour-blind users and pass WCAG AA at body size. It's the most distinctive direction of the three, and the most "warm" — closest to Bruce Tremper's avalanche books in feel. Risk: contour patterns can become visual noise if over-applied; we keep them at 15-30% opacity and only on hero bands.
